**Exam 70-241**: TS: Developing Business Process and Integration Solutions by Using Microsoft BizTalk Server 2006 R2

**Question: 1**

You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You develop three schemas all of which have a property named AccountID. They're respectively named Account, AccountOrder, and AccountAnswer. Now you create an orchestration which performs the following steps in sequence, the orchestration contains one Send shape, two Receive shapes, and several other shapes. First, the orchestration receives an incoming document, and the document matches the Account schema, second it maps the incoming document to the AccountOrder schema, and then it sends the AccountOrder message to the MessageBox database, receives messages that match the AccountAnswer schema back from the MessageBox database. At last if the AccountAnswer message indicates any errors, it logs a message to the event log. You develop a correlation set named CorrelationAccountID and a correlation type. Both of them re on the basis of the AccountID property. Now you have been assigned a task that you must ensure that multiple instances of the orchestration can run simultaneously, besides this, you must make sure that each one can process a unique account ID. In order to assure this, what actions should you do? (choose more than one)

- A. On the Send shape, you should initialize CorrelationAccountID.
- B. On the first Receive shape, you should initialize CorrelationAccountID.
- C. On the second Receive shape, you should initialize CorrelationAccountID.
- D. On the second Receive shape, you should set the Following Correlation property. Make it be equal to CorrelationAccountID.
- E. On the Send shape, you should set the Following Correlation property. Make it to be equal to CorrelationAccountID.

**Answer: C**

**Question: 2**

You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You develop an orchestration which contains several steps. You intend to use Business Activity Monitoring (BAM) to track the orchestration. You create a BAM definition. The BAM definition has several activities. What should you do to modify the dimensions that are associated with these activity components?

- A. You should utilize the Tracking Profile Editor (TPE).
- B. You should modify the Pivot Table Field List by using Microsoft Excel.
- C. You should use the Business Activity Monitoring Activity Definition Wizard.
- D. You should create a new rule in the policy by using the Business Rule Composer.

**Answer: B**

**Question: 3**

You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. The PassThru receive pipeline is used by a receive port. Inbound SOAP messages are not being validated against schemas. At the earliest stage in the receive pipeline, what should you do to validate the messages against the envelope and body schemas?

- A. First, you should configure the receive port and make it use the default XML receive pipeline. Second, the EnvelopeSpecNames property of the pipeline should be set to the envelope schema.
- B. First, you should create a custom receive pipeline. Add an XML validator in the Validate phase. Then configure the receive port and make it use the custom receive pipeline. Before you perform this, the Document schemas collection should be set to the envelope and body schemas.
- C. First, you should create a custom receive pipeline and add an XML disassembler in the Disassemble phase. And then configure the receive port and make it use the custom receive pipeline. Before you perform this, you should set the envelope and body schemas and the Validate document structure property should be set to True.
- D. First, you should create a custom receive pipeline and add a flat file disassembler in the Disassemble phase. And then configure the receive port and make it use the custom receive

pipeline. Before you perform this, the Validate document structure property should be set to True and you should set the envelope and body schemas.

**Answer: B**

**Question: 4**

You work in an international company which is named TXTWIN. And you're in charge of the company network and use Microsoft BizTalk Server 2006 R2. You develop an orchestration which performs the following:

- Perform mapping
- Process files from a receive port
- Send a message to a business partner.

The orchestration is running and the receive port is enabled, but the associated send port is unenlisted. A text file is dropped in the receive location. The message is not sent to your business partner despite that the orchestration finishes successfully. So what should you do to make sure that your business partner can receive the message?

- A. First, you should disable all breakpoints by using Health and Activity Tracking (HAT). Second you resubmit the file.
- B. First, you should save the message to a file directory by using Health and Activity Tracking (HAT). Second you resubmit the file.
- C. First, you should start the send port by using the BizTalk administration console. Second, you resume the suspended message.
- D. First, you should resume the suspended message by using the BizTalk administration console. Second, you enable the receive location and resubmit the file.

**Answer: B**
